

Cheetah's Administration Enhancements

John F. Miller III
IBM

A01
Monday, April 28, 2008 • 9:30 a.m. – 10:30 a.m.

2008 IIUG Informix Conference

Goal

To introduce improvements in the Informix Database Servers administration infrastructure. Showing the DBA how they can leverage new and existing tools to improve their TCO. A demo of the newly updated Graphical Administration highlighting the major components.

Agenda

- Introduction
- Administration Challenges
- Admin System Overview
- Featured Enhancements
 - Onstat & sysmaster
 - SQL Admin Commands
 - SQL Tracing
 - Database Scheduler
 - OpenAdmin Tool - Demo

IDS Administration Challenges

- IDS lacked a programmatic administration interface, only command line was available
 - Difficult for third parties to build an IDS administration tool
 - Partners and customers can not easily integrate administration into their applications
- Repetitive DBA tasks difficult to automate
- Need for a centralized Health Center usable for both the database and applications

Administration Free Zone

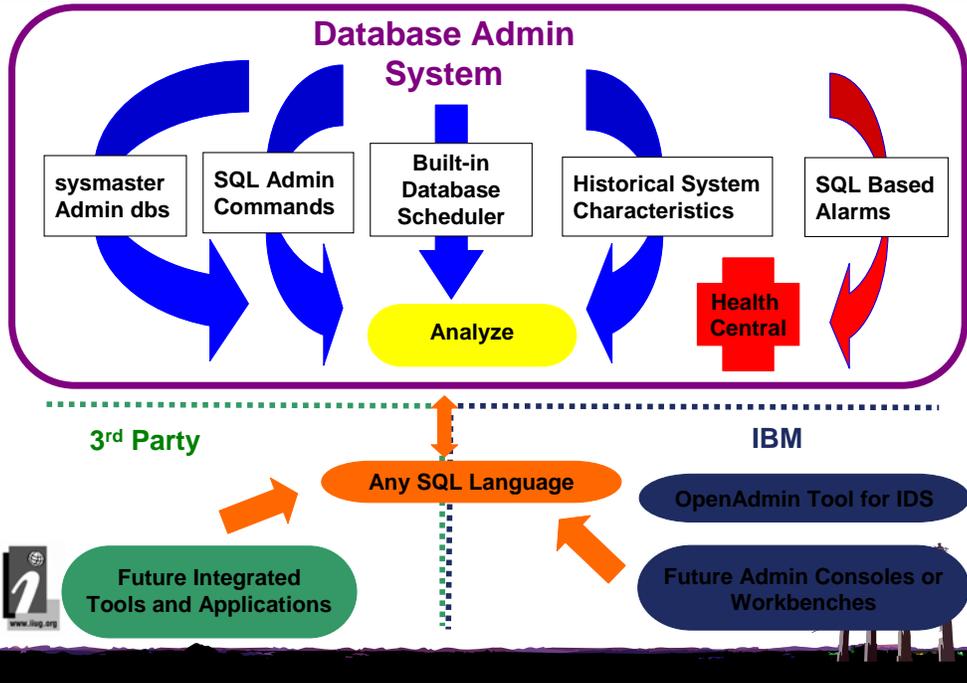

- Low Total Cost of Ownership and Deployment
- Easy Scalable Administration
- Open Admin API for customized administration
- Autonomic architecture
- Industrial strength, highly reliable - Install it, Set it up, and Forget about it.

Solutions

- Improvements to onstat
- Improved sysmaster database
- SQL Admin Commands
- SQL Query Tracing and Profiling
- Database Scheduler
- Health Management System
- OpenAdmin Tool for IDS (aka OAT)

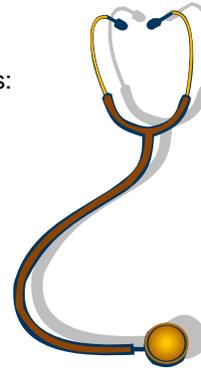

Laying the Foundation for Improvements

- A new database (sysadmin) for
 - Administrative functions
 - Alert System
 - Data collection
- Different methods for collecting information
- Additional information required to present in a way DBAs can understand

Improve Information for sysmaster and onstat

- Improve the display of information in the following areas:
 - Improved Thread Wait Information
 - Detailed Checkpoint Information
 - User/Server Environment Information
 - Online & onbar log files
 - Network Information (IO counts and times)
 - MGM Information
 - SQL Generic Cache Profiles
 - SQL Statement History

Make the information clear for the DBA to understand

New Sysmaster Tables

- **New Tables**

- syscheckpoint
- sysenvses
- sysenv
- sysonlineog
- sysbaract_log
- sysnetworkio
- sysdual
- syssqltrace
- syssqltrace_itr
- syssqltrace_info
- sysnetglobal
- sysnetclienttype
- [syslicenseinfo](#)
- [sysmachinfo](#)
- [syssqltrace_hvar](#)
- [MACH 11 Tables](#)

- **Tables Modified**

- systcblst
- sysscblst
- sysrstcb
- [sysvplist](#)

Current onstat -g ath

- Remove/Reduce the number of thread status of “sleeping forever”
- Give the DBA a clear picture of what is happening

```

SQL Admin Commands

- A set of User Defined Routines (UDRs) to administer the Informix database server.
- The major categories of administration include:
 - Space Management
 - Configuration Management
 - Routine task maintenance
 - System Validation (oncheck functionality)
- Feature Benefits
 - SQL Based Administration
 - Remote Administration
 - Tracking of command execution and results in a system table

Admin Commands – Two New UDRs

- Two UDRs called *task* & *admin* are part of the sysadmin database
- They perform exactly the same, only the return code is different
 - *task()* UDR returns a character string describing the return status

```
EXECUTE FUNCTION task('create dbspace', 'dbspace2', '/CHUNKS/dbspace2');  
(expression) created dbspace number 2 named dbspace2
```

- *admin()* UDR returns a integer return status which is a link to the *command_history* table

```
EXECUTE FUNCTION admin('create dbspace', 'dbspace2', '/CHUNKS/dbspace2');  
(expression) 107
```

- Both UDRS log all executions into a table called *command_history* in the *sysadmin* database

www.iiug.org

SQL Admin Commands - Parameters

- Environment Variable Expansion
 - A pathname may start with an environment variable.
 - The environment variable may only exist in the server's environment
- Unit Extensions
 - All offsets and sizes can be provided with unit extensions
 - The extensions are case insensitive
 - Default is KB
 - PB, TB, GB, MB, KB, B

SQL Admin Commands – EXAMPLE

```
EXECUTE FUNCTION  
    admin('create dbspace','dbs2','$INFORMIXDIR/dbspace2','20MB`'  
(expression)          108
```

```
SELECT * FROM command_history WHERE cmd_number IN (108);
```

```
cmd_number      108  
cmd_exec_time   2005-11-17 16:26:15  
cmd_user        informix  
cmd_hostname     olympia.vernco.com  
cmd_executed     create dbspace  
cmd_ret_status   0  
cmd_ret_msg      created dbspace number 2 named dbspace2
```

DBA Constant Struggle

Identifying Performance Bottlenecks in SQL Statements

- Current methods for examination
 - Set explain
 - Looking at database objects accessed by the SQL for inefficiency
- Lack of simplicity in the process
- Hard to build a repeatable process

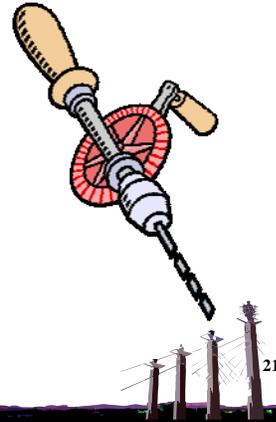

Questions DBAs like to ask?

- How long did a SQL statements take?
- How many resources of each category did a statement take?
 - Disk I/O
 - Memory
 - CPU
- How long and how many times did we wait on each resource?
 - Locks
 - Disk I/O

SQL Query Drill Down Feature

- Provide consolidated detail information about SQL statements through all layers
- Information available through
 - Onstat
 - sysmaster database
 - OpenAdmin Tool for IDS (aka OAT)
- Dynamically configurable
- Global and User Tracing modes
- Find the slowest query with only three clicks of the mouse

Controlling SQL Query Drill Down

- ONCONFIG variable SQLTRACE
 - Level =[off,low,med,high]
 - Ntraces=[number of traces]
 - Size=[size of each trace buffer in KB]
 - Mode=[global|user]

```
SQLTRACE level=low,ntraces=2000,size=1,mode=global
```

- Turn off SQL Tracing for session id 147

```
execute function task("SET SQL USER TRACING OFF",147);
```

Controlling SQL Query Drill Down

- Dynamically enable or modify SQL Tracing
 - Trace 2000 SQL statements
 - Trace 1024 bytes of data for each SQL statement

```
execute function task("SET SQL TRACING ON",2000,1);
```

- Turn off SQL Tracing

```
execute function task("SET SQL TRACING OFF");
```

SQL Query Drill Down - onstat

```

```

Built-in Database Scheduler

- Ability to schedule SQL, Stored procedures or a UDR
- The schedule entities are called “tasks”
- There are different types of tasks
 - Tasks
 - Sensor
 - Startup Task
 - Startup Sensor
- Tasks are driven by the data inside a table called ***ph_task***

- Sensors are a specialized task designed to collection information
 - Easy to add and configure
 - Collect information and stores it in database tables

Why use Tasks and Sensors?

- A way of ensuring routine jobs get completed
- Periodically check and/or analyze collected data to ensure the data server is operating efficiently
- Sensors provide a simple way of collecting information
 - Easy to add a new sensor
 - Provide a portable way of collecting information without using the operating system.

Admin Console

What is OpenAdmin Tool for IDS?

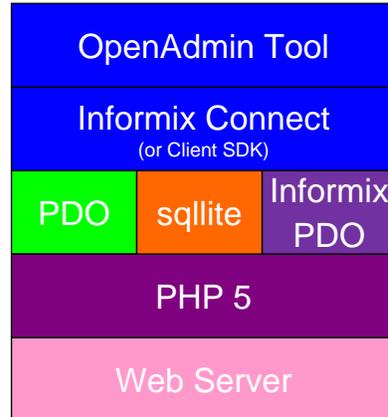

- OAT is a web-based administration tool for the IBM Informix Database Server V11 and moving forward
- A single OAT installation can administer one or more data servers
- No additional software is needed on the data server

The OAT Stack

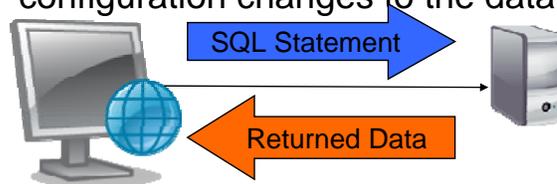

- Components which are required to run OpenAdmin Tool for IDS
- 100% Free
- Available from various sources
 - Individual pieces
 - Bundles
 - Zend Core for IBM
 - XAMPP

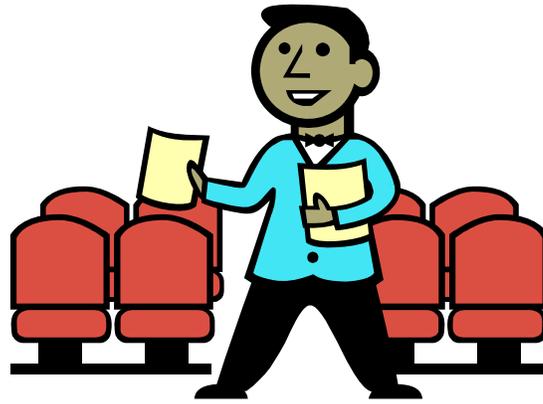

OAT Data Server Interaction

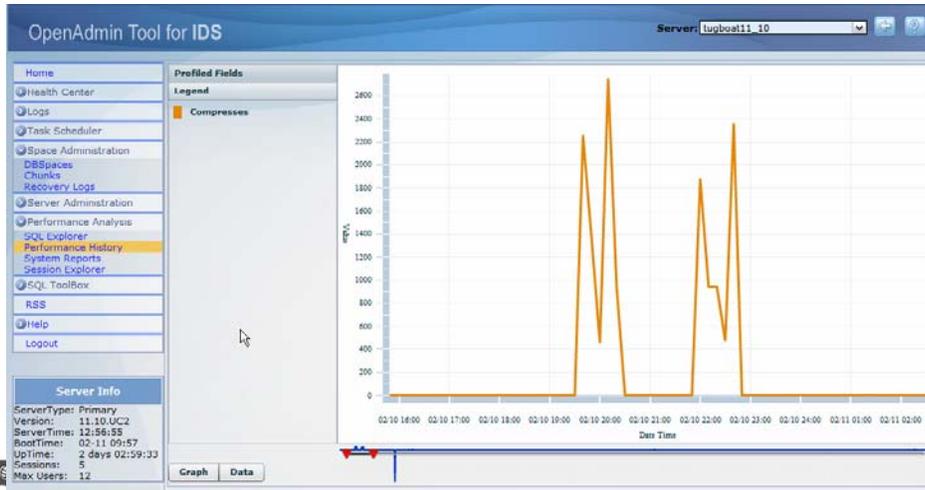

- OAT accesses the data server using only standard SQL statements
 - Uses the existing sysmaster database to retrieve performance and monitoring data
 - Utilizes the SQL Admin API to make configuration changes to the data server
